

Hardware and software installation options

To connect to the Business.Ru service, there are three options for installing equipment and software, which depend on the cash register used.

1	<p>In case of autonomous cash register, (Starrus 1FA (1FS), Umka 01FA or Terminal-FA), a direct connection between the service and the cashier is used. To connect the cash register to the service, it is necessary to connect the cash register only to the local network of the enterprise. In this case, a computer with software is not needed, since these cash registers have a microcomputer as part of the device. You just need to specify the ports to the cash register, and then in the personal account of the Business.Ru service, specify the IP: port, login and password to access the cash register (the first is set during setup, the second and third are default values). When the Business.Ru service receives information about the payment, it will send it directly to the cash register.</p>
2	<p>In case of standard fiscal registrar, which does not have an embedded microcomputer (ATOL, Shtrikh-M, etc.), the Online Receipts application is downloaded and installed on the cashier's personal computer. After registering in the personal account of the Business.Ru Online-Checks service, click the button to download the distribution kit and install it. After installation, the application is automatically authorized (for this you should use <code>install key</code>) - everything is ready to go.</p> <p>The application independently receives information from the service, so no additional settings are required. This option is designed for users who want to connect with an existing cash register (for example, from their retail outlet), or are looking for a single checkout solution for a regular and online store.</p>
3	<p>In case of Evotor (5, 7.2, 7.3, 10), the user must pay for and download the Online Receipts application from the Evotor Marketplace. After downloading the application, the user is authorized with the data of the personal account of the service (the login and password specified when creating the Business.Ru Online-Checks account) and the application then independently takes information about payments from the service. Evoto is a solution for a regular store, an online store and a courier (courier only with Evotor 5 and 7.3 models).</p>
